

# OLED\_SPIflash

Add-on Library for OLED\_I2C and SPIflash

## Manual

The logo for Rinky-Dink Electronics features the company name in a stylized, glowing cyan font with a 3D effect. The text is set against a dark background that includes a close-up image of a green printed circuit board (PCB) with various electronic components and traces.

Rinky-Dink Electronics

## Introduction:

This library is an add-on to OLED\_I2C and will not work on its own.  
This add-on library also requires the SPIflash library.

This library adds a simple way to load images from SPI flash chip. The images must be contained within the SPIflash file system. Images can be added to the flash chips using the FlashUploader tool supplied with the SPIflash library.

## EXAMPLE DATASETS USED:

These files can be found in the `/SPIflash/tools/FlashUploader/Example Datasets` folder.

Full name	Short name	Minimum Flash Chip Size (Mbits)
TestImages_Mono.*	MONO.SFD	2 Mbits
TestImages_Mono_Large.*	MONO_L.SFD	2 Mbits

These files can be found in the `/OLED_SPIflash/DataSet` folder.

Full name	Short name	Minimum Flash Chip Size (Mbits)
TestImages_OLED.*	OLED.SFD	2 Mbits

The specific dataset required by an example sketch it will be noted in the opening comments of that sketch.

---

You can always find the latest version of the library at <http://www.RinkyDinkElectronics.com/>

For version information, please refer to `version.txt`.

This library is licensed under a **CC BY-NC-SA 3.0** (Creative Commons Attribution-NonCommercial-ShareAlike 3.0 Unported) License.

## FUNCTIONS:

### OLED\_SPIflash(OLED, SPIflash);

The main class constructor.

Parameters:     OLED:        a reference to an already created OLED\_I2C (OLED) object  
                  SPIflash: a reference to an already created SPIflash object

Usage:            OLED\_SPIflash myFiles(&myOLED, &myFlash); // Create an instance of the OLED\_SPIflash class

Notes:            Remember the '&' in front of the OLED and SPIflash object names

### loadBitmap (fileID, x, y);

Load a monochrome image from the flash chip and display it on the screen.

Parameters:     fileID: ID of the file you want to open for reading  
                  x:        x-coordinate of the upper, left corner of where to display the image  
                  y:        y-coordinate of the upper, left corner of where to display the image

Usage:            myFiles.loadBitmap(12, 0, 0); // Load the image with fileID 12 and display it

Notes:            Image dimensions are stored in the flash chip file system. No checking is done if the image will fit on the screen. Drawing images outside the screen may cause unpredictable results.

### loadBitmap(fileid, x, y, ox, oy, sx, sy);

Load a section of a monochrome image from the flash chip and display it on the screen.

Parameters:     fileID: ID of the file you want to open for reading  
                  x:        x-coordinate of the upper, left corner of where to display the image  
                  y:        y-coordinate of the upper, left corner of where to display the image  
                  ox:       x-coordinate of the upper, left corner of the section in the original image  
                  oy:       y-coordinate of the upper, left corner of the section in the original image  
                  sx:       width of the section in pixels  
                  sy:       height of the section in pixels

Usage:            myFiles.loadBitmap(6, 0, 0, 100, 100, 128, 64); // Load the image with fileID 6 and display a part of it

Notes:            Original image dimensions are stored in the flash chip file system. No checking is done if the image will fit on the screen or if the section you are trying to display is within the bounds of the image. Drawing images outside the screen may cause unpredictable results.
